

Australian Standard<sup>®</sup>

---

**Plain limit gauges  
(metric series)**

---

The following scientific, industrial and governmental organizations were officially represented on the committee entrusted with the preparation of this standard:

Associated Chambers of Manufactures of Australia  
Department of Defence  
Department of Productivity  
Federal Chamber of Automotive Industries  
Institution of Production Engineers  
Metal Trades Industry Association of Australia  
National Measurement Laboratory  
Queensland Institute of Technology  
Railways of Australia Committee  
Society of Manufacturing Engineers  
The Institution of Engineers, Australia  
University of New South Wales  
Weapons Research Establishment

---

This standard, prepared by Committee ME/27, Metrology, was approved on behalf of the Council of the Standards Association of Australia on 7 December 1976, and was published on 1 August 1977.

---

**Review of Australian Standards.** *To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.*

*Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.*

*Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.*

---

*This Standard was issued in draft form for public review as DR 76043.*

## PREFACE

This standard was prepared by the Association's Committee on Metrology as part of its program of providing a rational range of specifications for measuring equipment in metric units.

Since the issue of AS 1654, Limits and Fits for Engineering (Metric Units), it became necessary to revise AS B195, Plain Limit Gauges (Inch Units), in order to take account of metric conversion, but more importantly to include the maximum material condition (MMC) and least material condition (LMC) limit concept introduced in AS 1654.

AS 1654 is based on ISO/R286, ISO System of Limits and Fits, which relates mainly to tolerances and deviations for workpieces, and does not include requirements for gauges. The ISO Technical Committee (TC 3), realizing this deficiency, subsequently prepared ISO/R1938/II, ISO System of Limits and Fits; Inspection of Plain Workpieces.

It was considered by the SAA committee that ISO/R1938/II formed a reasonable basis for an Australian standard for gauges for workpieces up to and including 500 mm only. For sizes over 500 mm, ISO/R1938/II includes experimental data which contain a serious anomaly that is considered to be quite unacceptable in an Australian standard. Briefly, for sizes over 180 mm, ISO/R1938/II introduces 'safety zones' ( $\alpha$  and  $\alpha_1$ ) to take into account uncertainties in the measurement of these larger gauges and which encroach into the workpiece tolerance. The magnitude of this amount, and its disposition relative to the GO gauge member, in sizes over 500 mm is such that the 'new gauge' tolerance zone lies outside the theoretical wear limit as determined by the  $\alpha$  and  $\alpha_1$  values.

With the exception of the foregoing, however, this standard embodies all other essential features of

ISO/R1938/II as related to plain limit gauges, and gives tolerances to be applied to gauges intended to be used for the inspection of workpieces made to the metric limits given in AS 1654. With regard to gauge tolerances and deviations and their relationship to the workpiece limits, this standard is identical with ISO/R1938/II, although both the text and the numerical data have been differently presented to provide a clearer understanding of the subject. It should be noted that this standard does not contain reference to the inspection of workpieces by direct measurement, and it is anticipated that this will be the subject of a further Australian standard.

Attention is drawn to the fact that gauges may be tested for conformance to this standard by the National Measurement Laboratory, or by laboratories registered with the National Association of Testing Authorities for the appropriate class of test.

This standard may require reference to AS 1654 and AS B195 and to the following:

AS 1965 Measurement of Surface Roughness with Direct-reading Stylus Electronic Instruments

AS B129 Designs for Geometric Limit Gauges (Plain and Screwed in Inch Units).

In accordance with the practice adopted in AS 1100, Engineering Drawing Practice, the decimal comma has been used in this standard.

This standard supersedes the metric information given in AS B195, but that standard will remain in force for an interim period to satisfy the requirements of those using the imperial system of measurements.

## © Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

STANDARDS ASSOCIATION OF AUSTRALIA

**Australian Standard Specification  
for  
PLAIN LIMIT GAUGES—METRIC SERIES**

SECTION 1. SCOPE, TERMS AND SYMBOLS

**1.1 SCOPE.** This standard describes the types of gauges and gauging procedures used for the assessment of the conformance to dimensional specification of plain workpieces. The standard covers a size range up to and including 500 mm for gauges for holes, and up to and including 315 mm for gauges for shafts. The limitation of the size range for gauges for shafts is due to the fact that there is no international agreement on these types of gauges for sizes over 315 mm. The standard is presented as appropriate to plain cylindrical surfaces, but the principles may be used for other geometric forms.

The standard defines the types of gauges and their applications, specifies tolerances and wear limits for gauging surfaces, establishes minimum requirements for gauge materials and recommends gauging methods and procedures for resolving possible disputes. Interpretation of the limits of size, including geometric deviations and provisions for gauge identification are also included.

The design and material requirements are limited to those affecting gauging surfaces and performance of gauges.

The main section of the standard is limited to sizes up to 180 mm, with sizes over 180 mm given in Appendix D. Other appendices contain information on interpretation of workpiece limits of size and

the Taylor principle; verification of gauges; derivation of gauge deviations; examples in the use of the tables; temperature effects.

**1.2 TERMS AND DEFINITIONS.** For terms and definitions used in this standard, see AS B129\* and AS 1654†, Section 1.

**1.3 SYMBOLS.** For the purpose of this standard the following symbols are used (see Fig. 1):

- $T$  = tolerance on gauges for holes
- $T_1$  = tolerance on gauges for shafts
- $y$  = margin outside the MMC workpiece limit for the wear limit of gauges for holes
- $y_1$  = margin outside the MCC workpiece limit for the wear limit of gauges for shafts
- $z$  = distance between centre of tolerance zone of new GO gauges for holes and the MMC workpiece limit
- $z_1$  = distance between centre of tolerance zone of new GO gauges for shafts and the MMC workpiece limit.

\* AS B129, Designs for Geometric Limit Gauges (Plain and Screwed in Inch Units).

† AS 1654, Limits and Fits for Engineering (Metric Units).

NOTE:  $y$  and  $y_1$  exist only for grades 6, 7 and 8. In all other cases  $y = y_1 = 0$ .
