

BSI Standards Publication

Space engineering — High voltage engineering and design handbook

National foreword

This Published Document is the UK implementation of CEN/CLC/TR 17603-20-05:2021.

The UK participation in its preparation was entrusted to Technical Committee ACE/68, Space systems and operations.

A list of organizations represented on this committee can be obtained on request to its committee manager.

Contractual and legal considerations

This publication has been prepared in good faith, however no representation, warranty, assurance or undertaking (express or implied) is or will be made, and no responsibility or liability is or will be accepted by BSI in relation to the adequacy, accuracy, completeness or reasonableness of this publication. All and any such responsibility and liability is expressly disclaimed to the full extent permitted by the law.

This publication is provided as is, and is to be used at the recipient's own risk.

The recipient is advised to consider seeking professional guidance with respect to its use of this publication.

This publication is not intended to constitute a contract. Users are responsible for its correct application.

European Foreword	10
Introduction	11
1 Scope	12
2 References	13
3 Terms, definitions and abbreviated terms	17
3.1 Terms from other documents	17
3.2 Terms specific to the present document	17
3.3 Abbreviated terms.....	21
4 High voltage design considerations	23
4.1 Environment	23
4.1.1 Impact of environment.....	23
4.1.2 Pressure	23
4.1.3 Temperature	25
4.1.4 Energetic Particle Radiation	26
4.1.5 Space Debris and Micrometeoroids	27
4.1.6 Plasma.....	27
4.1.7 Mechanical.....	28
4.2 Electrical insulation	28
4.2.1 Categories of insulation.....	28
4.2.2 Gaseous insulation.....	28
4.2.3 Liquid insulation	31
4.2.4 Solid insulation.....	32
4.2.5 Vacuum insulation.....	35
4.2.6 Composites.....	36
4.3 Life limiting factors	36
4.3.1 Perspective	36
4.3.2 Electrical breakdown	37
4.3.3 Partial discharges	43
4.3.4 Paschen breakdown.....	46

4.3.5	Ageing.....	48
4.4	Typical applications	54
4.4.1	DC-DC High voltage power conditioners	54
4.4.2	Electronic power conditioners for TWTA	56
4.4.3	Electric propulsion.....	63
4.4.4	Microwave tubes	70
4.4.5	Scientific instruments and experiments	73
5	High voltage design principles.....	75
5.1	Basic design principles	75
5.1.1	Control of voltage	75
5.1.2	Control of electrical field strengths	76
5.1.3	Control of electrical field distribution.....	87
5.1.4	Control of insulation properties.....	89
5.1.5	Control of surface properties	92
5.1.6	Control of partial discharges.....	93
5.1.7	Control of corona effects	95
5.1.8	Control of Paschen breakdown	95
5.1.9	Control of triple junction effects	98
5.1.10	Control of creepage path.....	99
5.1.11	Control of surface charging	100
5.1.12	Control of interferences.....	102
5.2	High voltage assemblies	105
5.2.1	Solid insulation: potted modules.....	105
5.2.2	Solid insulation: others	125
5.2.3	Gaseous insulation.....	127
5.2.4	Liquid insulation (Oil).....	132
5.2.5	Space vacuum insulation	133
5.3	High voltage components	141
5.3.1	Transformers and inductors	141
5.3.2	Capacitors.....	144
5.3.3	Resistors.....	147
5.3.4	Semiconductors	149
5.3.5	Wires and cables	149
5.3.6	Connectors	154
5.3.7	Interconnections.....	155
5.3.8	Insulators and spacers	157
5.3.9	Feedthroughs.....	158

5.3.10	Printed circuit boards	159
5.3.11	Other components.....	161
6	High voltage testing	162
6.1	Non-Destructive Testing	162
6.1.1	Insulation Resistance Test (INR).....	162
6.1.2	Bulk Resistance Measurement (BRM).....	163
6.1.3	Surface Resistance Measurement (SRM)	164
6.1.4	Polarisation and Depolarisation Current Measurement (PDC).....	165
6.1.5	Dielectric Loss Factor Test (DLF).....	166
6.1.6	Partial Discharge Test (PDT)	167
6.1.7	Dielectric Withstanding Voltage Test (DWV)	173
6.1.8	Triple Junction Test (TRJ).....	175
6.1.9	Critical pressure testing/Corona testing (CPT)	177
6.1.10	Life testing (LIT)	180
6.1.11	Accelerated life testing (ALT)	181
6.1.12	Burn-in testing (BIT).....	182
6.2	Destructive Testing.....	183
6.2.1	Breakdown Voltage Test (BVT).....	183
6.2.2	Lifetime evaluation testing (LET).....	184
6.3	Supplementary Methods	185
6.4	Testing strategy	186
7	High voltage product aspects	189
7.1.1	Best practice for materials and processes selection.....	189
7.1.2	Best practice for design.....	191
7.1.3	Best practice for qualification	193
7.1.4	Best practice for flight acceptance.....	194
7.1.5	Best practice for verification	195
7.1.6	PID.....	196
7.1.7	Evaluation Plan	197
8	Specific problem areas	198
8.1.1	High voltage converters	198
8.1.2	Electric propulsion.....	200
8.1.3	Electron devices (tubes).....	205
8.1.4	Scientific instruments and experiments	205
8.1.5	EMC aspects.....	205
9	Hazards and safety.....	207

9.1 Hazards	207
9.2 Safety	207
Annex A High Voltage Field Calculation Tables	208
A.1 Principles of field efficiency factors for spheres and cylindrical geometries ..	208
A.2 Spherical geometries	209
A.3 Cylindrical geometries	210
Annex B Best Practice References	212
B.1 High Voltage Evaluation Plan	212
B.1.1 Evaluation Activities	212
B.1.2 Evaluation Plan	212
B.1.3 Manufacturing of Evaluation Samples	213
B.1.4 Test and Characterisation	213
B.1.5 Evaluation Review.....	213
B.2 Materials Evaluation	214
B.3 PID – Process Identification Document.....	218

European Foreword

This document (CEN/CLC/TR 17603-20-05:2021) has been prepared by Technical Committee CEN/CLC/JTC 5 "Space", the secretariat of which is held by DIN.

It is highlighted that this technical report does not contain any requirement but only collection of data or descriptions and guidelines about how to organize and perform the work in support of EN 16603-20.

This Technical report (TR 17603-20-05:2021) originates from ECSS-E-HB-20-05A.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association.

This document has been developed to cover specifically space systems and has therefore precedence over any TR covering the same scope but with a wider domain of applicability (e.g.: aerospace).

Introduction

The subject of high voltage engineering and design has been part of the spacecraft design process since the early times of spaceflight.

This was due to need for high voltage power conditioners being a key element of communication links. The relate expertise was built up in Europe in the decade of the 1980 with the support of the development of modern Electronic Power Conditioners (EPC's), to operate Travelling Wave Tube Amplifiers for telecommunication satellites and for high power radar applications.

In 1989 ESA launched its first high power radar for earth observation onboard the ERS-1 (European Remote Sensing Satellite), achieving a technology for 15 kV – 17 kV in space.

Today typically between some ten and over hundred EPC's with operating voltages of 5 kV - 8 kV are placed on many of the telecommunications satellites.

Several space borne radars with travelling wave tubes and klystrons are in orbit using voltage up to 20 kV. Various detectors for various kind of space environment with voltage between a few hundred volts and up to 30 kV are used in many missions, high power lasers up to 150 kV were studied, and even some experiments onboard the International Space Station using fancy high voltage sources.

The latest trend is the increasing use of electric propulsion for satellites dealing with supply voltage in the range between a few hundred volts and above 10 kV. High voltage related anomalies have been observed only a few times, some in the early years of building up experience, some also later, especially when new developments were done with new teams inexperienced in the field.

A need was identified for a standard already in the early years of the space flight, the US air force and NASA presented a series design and test handbook in the 1970's and 1980's. In Europe, ESA started discussing a draft standard with industry: the PSS-02-303 draft 2 from 1992 "Requirements for High Voltage Transformer and Components used in Electronic Power Conditioners for ESA Space Systems" this became a quasi standard reference in many space projects, even if it was never formally released. The growing diversity of high voltage application gave finally the urgency to make a new approach for standardization. The discussion started in 2007 with ECSS who led to the conclusion, that a standard would not satisfy the immediate needs for projects, as it would be too wide to cover the diverse applications and also would not be suitable to transfer the "know-how" of high voltage engineering and design. Therefore it was decided to produce a handbook to give a broad scope of knowledge and recommendations for design and test of high voltage equipment and components.

This document aims to satisfy these needs and provides a detailed view of high voltage knowledge aspects as well as giving a guideline to identify suitable design rules.

Proper design of high voltage effects of these processes is part of the system engineering process as defined in ECSS-E-ST-20, where only a small subset of high voltage requirements is given.

For new projects involving high voltage equipment and design it is useful to provide this handbook as a reference to generate suitable requirements specific to the targeted high voltage application.

Chapter 7 of this document gives some "best practice" statements.

Only a smart answer can be given to the definition of the range of voltages which should be considered as high voltages: The ECSS-E-ST-20C states for the definition of a high voltage "AC or DC voltage at which partial discharges, corona, arcing or high electrical fields can occur". For space environment this can occur ". This in fact can already appear at 60 V – 80 V if a low pressure environment in an inert gas provides a critical pressure for "Paschen Breakdown". Under air (N₂/O₂ mixtures) this can occur for voltage of above 300 V.

1

Scope

This Handbook establishes guidelines to ensure a reliable design, manufacturing and testing of high voltage electronic equipment and covers:

- Design
- Manufacturing
- Verification/Testing

of equipment generating, carrying or consuming high voltage, like: high voltage power conditioner, high voltage distribution (cables and connectors).

This Handbook is dedicated to all parties involved at all levels in the realization of space segment hardware and its interface with high voltage for which ECSS-E-ST-20C is applicable.

This handbook sets out to:

- summarize most relevant aspects and data of high voltage insulation
- provide design guidelines for high voltage insulation
- provide design guidelines for high voltage electronic equipment
- give an overview of appropriate high voltage test methods
- establish a set of recommendations for generation design and verification rules and methods
- provide best practices

Applicability is mainly focused on power conditioning equipment but may be also applicable for all other high voltage electric and electronic power equipment used on space missions, except items of experimental nature.
