Foreword

This British Standard has been prepared under the direction of the Automobile Standards Committee to establish a safe standard of performance for vehicle support stands and to ensure that they are sufficiently robust so that under normal use they will not fail. The standard also aims to ensure that the vehicle support stands are constructed and designed so that they will be stable and will not damage the vehicle when used in the intended manner.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

1 Scope

This British Standard specifies requirements for the design, construction, performance and marking of vehicle support stands for cars and light vans.

2 Definitions

For the purposes of this British Standard, the following definitions apply.

2.1 vehicle support stand. A device of fixed or adjustable height on which an appropriate part, e.g. axle, chassis, of a raised vehicle is supported.
